

Wear is unlimited...

"Jyoti Cero Products" brings it within limit

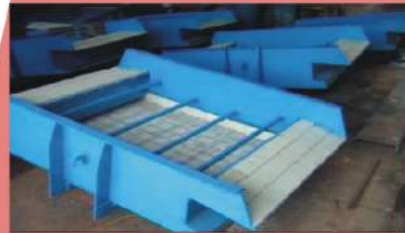

MOTTO : INNOVATE TO PROTECT

SIEVE BEND CASHING

We have developed Sieve bend casing with Ceramic Lining which has enhance the life of equipment in many fold. It is mainly used in coal washeries. Sieve bend casing is widely used for sizing, de-watering and medium draining of materials.

Application:

Sieve bend casing mainly used for Industrial coal materials grading, dewatering and medium. The material enters the screen surface at a certain speed, because of the force, materials are stick to screening surface to take motion. As the material layer flows from one sieve to another, the edges of each sieve have a cutting effect on the material layer. Under the action of centrifugal force, the material after cut is discharged through the sieve, and it becomes the undersize fall into the undersize chute; the part that has not been cut become the oversize cross the root sieve and fall into the oversize chute.

ROTATOR AND STABLIZER

We have developed rotator and stablizer coated with cero hard material which has enhance the life of equipment in many fold.

It is most commonly used in coal washeries. The coal preparation plants produce large quantities of coal slurry. Rotator and stabilizer is used to dilute coking coal fines by its rotation.
